

ABSTRACT

The present invention is relative to an electronic apparatus system including one or more electronic apparatus and an inputting device. A preset sequence of operations, pertaining to the mode of commercial demonstration, is carried out on the electronic apparatus (20), in response only to a preset command transmitted by the inputting device (10). Even if there are provided a plural number of the electronic apparatus (20) in the system, the operation for booting the mode of commercial demonstration for these plural electronic apparatus (20) may be carried out with the sole inputting device (10). This inputting device (10) is to be supplied only to an entity undertaking the commercial demonstration, such as a retail store. This disables the inputting device (10) to be used by the users at large so that the mode of commercial demonstration cannot be booted during use of the electronic apparatus by the users at large.
